

Vulnerability Management

Your adversaries are scanning your environment looking for weaknesses, so why wouldn't you beat them to it, find where you are vulnerable and remediate those issues before there is any data loss and impact to the business?

Vulnerability management is critical to most compliance standards, such as PCI DSS 11.2, and it's an activity that needs to be an ongoing process, not something that is done ad hoc, when you have the time.

WHAT IS VULNERABILITY MANAGEMENT?

A critical function in a layered security model, Vulnerability Management is the process of routine scanning of your environment for security vulnerabilities and the process by which those vulnerabilities are risk-scored and remediated.

WHAT IS THE **PeakPlus SECURE** VULNERABILITY MANAGEMENT SOLUTION?

Most vulnerability scanning platforms use a common source for vulnerabilities, the CVE (Common Vulnerabilities and Exposures) database (cve.mitre.org), so that the findings are very similar. Where most tools struggle is the delivery of that information in a way that IT professionals can prioritize their remediation actions. The reports are fine for delivery to a compliance auditor, much less so for the team that has to take action.

Pinnacle's Vulnerability Management services combine the tools to extract the data, with dashboards and reporting that all are applicable to all user types (Executive, VP/Director, and Admin) and follow that up with an expert team of security professionals who can help interpret the data when necessary.

WHY **PeakPlus SECURE**?

Purchased tools often go unused or unoptimized because of lack of consistent process, and reporting is far too often to simply check a box in compliance. Pinnacle's services utilize efficient tools that are highly automated to minimize costs, and present that data in a way to empower our customers.
